CANKER SORES

The pain and discomfort of apthetous ulcers (canker sores) and herpetic lesions (cold sores) can be stopped in only a few minutes of laser treatment. The energy of the laser destroys the virus and helps speed up the healing process.

CARIES

No more drills and annoying vibrations for caries removal: the laser beam can eliminate tooth decay without any direct contact on the tooth's surface.

WHITENING

The laser is undoubtedly the fastest and most effective way to achieve naturally white teeth. The laser light is used to activate a special whitening gel that can also be used on sensitive teeth, without discomfort.

COSMETICS

Healthy pink gums: lasers can help you achieve a perfect smile by easily removing unsightly stains on gums and improving the overall appearance of your smile.

BLEEDING GUMS

Gum disease, also known as periodontitis, can lead to tooth loss if not properly treated. Laser technology helps in fighting the infection of the gum tissue and stimulates natural healing, without drugs or anaesthetics.

GUMMY SMILE

Laser gum contouring is the best way to improve a 'gummy smile'. Instead of traditional tools the laser can trim away any excessive gum overlying the teeth. This is a quick, painless and bloodless treatment.

PAIN RELIEF

Laser biostimulation is a safe and effective way to heal trismus disorder and other painful oral conditions, especially after surgery. Pain relief with laser therapy is effective, fast and drug free.

SURGERY

Compared to conventional oral surgery, laser cutting is a virtually bloodless procedure. You will not feel much pain and post-op recovery will be much faster.

IMPLANTS

If you are in need of an implant or already have one, lasers are an indispensable tool that will reduce the time and the possible complications that can arise from oral implants.
