

Pluser

The all tissue erbium laser for dentistry and aesthetic medicine

The erbium laser PLUSER is a remarkable tool designed for dentists that wish to improve their patient's well-being: less discomfort, less pain, less anaesthetics, faster treatment and faster recovery mean greater patient satisfaction.

The erbium laser operates without vibrations and does not induce thermal damage on tissue. It can be used on soft tissue, hard tissue and surgery without any contact or vibration. It is especially useful for conservative treatments and bone surgery. Pluser erbium laser offers a choice of a gaussian or square shaped pulse with a full 10W of power. The Multiple Square Pulse mode transmits the exact energy required to the laser beam on the targeted tissue.

Thanks to many years alongside practitioners and research institutes, Doctor Smile has developed an important advancement in the field of handpieces with the creation of the outstanding PLUSER BOOST:

it is a tip-less instrument that focuses the laser beam, allowing precision cutting and fast diameter variations without the fuss of changing tips, reducing at the same time the risk of cross contamination. PLUSER handpieces are light and extremely manageable, designed for smooth operation in different positions. They can be sterilized in the autoclave and have an aiming beam as a guide during use.

Pluser's display is always visible during use: a powerful software with pre-set treatments for easy selection also has a built-in video guide containing treatment protocols.

The PLUSER's potential can also be used in medical aesthetics: the PLUSER DERMA includes the Full Field handpiece for aesthetic treatment; the PLUSER FRACTIONAL includes a fractional scanner for skin rejuvenation.
